

# WordPress Architectural & System Stability Audit

Structural assessment of the production WordPress / WooCommerce origin behind Cloudflare ([www.ccpatio.com](http://www.ccpatio.com)), prepared for handback to the development agency prior to further feature work.

## EXECUTIVE VERDICT

The origin is in a failure-prone configuration. PHP OPcache is saturated, PHP 8.2 is past End-of-Life, and NitroPack is stacked on Cloudflare while 38 active plugins (including dual page builders and Broken Link Checker) inflate every dynamic request. Intermittent Cloudflare

### HTTP 522

origin timeouts are consistent with origin PHP stalls under this stack — not with Cloudflare itself being unavailable.

2. Priority findings

3. Infrastructure & environment

4. Caching & network ingress conflicts

5. Plugin architecture & bloat analysis
6. System communication flow

7. Prioritized remediation punch list

8. Stability gate (stop-ship criteria)

9. Appendix — evidence snapshot

## 2. Purpose & scope

This audit evaluates architectural and operational stability of the WordPress infrastructure operated for CC Patio and built/maintained by PrimeView. Staging has been reported as fragile (PHP 8.2, intermittent Cloudflare 522s, heavy plugin load including NitroPack, Elementor, and Spectra).

**In scope:** runtime environment, caching topology, plugin overlaps, request path, and a concrete remediation punch list.

**Out of scope:** visual redesign, VividWorks configurator feature work, and catalog merchandising — all deferred until the stability gate in §8 is met.

## 3. Priority findings

|                                                                                                                                                                                                                                                 |          |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| OPcache saturated — primary 522 driver                                                                                                                                                                                                          | CRITICAL |
| Opcode cache is FULL. Interned strings at 100% (24 bytes free of 8 MB). Hit rate only 56.64%. Every cold/miss request recompiles PHP under LiteSpeed → origin stalls past Cloudflare’s ~100s handshake timeout → HTTP 522.                      |          |
| PHP 8.2 is past End-of-Life                                                                                                                                                                                                                     | CRITICAL |
| Runtime is PHP 8.2.33. PHP 8.2 reached EOL November 2025. As of September 2026 there are no security patches. Staging/production should target PHP 8.3 (or 8.4) after a plugin compatibility matrix.                                            |          |
| NitroPack + Cloudflare double-proxy stack                                                                                                                                                                                                       | CRITICAL |
| WP_CACHE=true, advanced-cache.php drop-in present, NitroPack 1.20.1 active while Cloudflare proxies the edge. Classic purge storms, origin loopbacks for optimization, and competing TTL policies that amplify origin load during cache misses. |          |
| 38 active plugins + dual builders                                                                                                                                                                                                               | HIGH     |
| Elementor 4.2.4 + Elementor Pro 4.2.3 alongside Spectra Legacy 2.20.3 and Astra Pro. Two page-builder stacks on every frontend bootstrap. Plugin tree alone is 593 MB on disk.                                                                  |          |
| Broken Link Checker active in production                                                                                                                                                                                                        | HIGH     |
| BLC 2.4.14.1 continuously crawls and writes to the database. On a ~47 GB media site this is a known origin-CPU / MySQL contention source and should be offline or scheduled off-peak via CLI only.                                              |          |

|                                                                                                                                                                                                                      |               |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| <b>WP_DEBUG enabled in production</b>                                                                                                                                                                                | <b>HIGH</b>   |
| WP_DEBUG=true with log to /home/ccpatplive/logs/ccp-wp-errors.log. Extra logging I/O under load worsens LiteSpeed worker saturation. Keep DEBUG_LOG only if rotated and sampled under incident flag.                 |               |
| <b>Uploads balloon: 43.69 GB</b>                                                                                                                                                                                     | <b>MEDIUM</b> |
| Media library is ~92% of total site footprint (47.42 GB). Imagick is available but upload_max_filesize is only 20 MB — legacy originals likely retained without WebP/AVIF lifecycle or object-storage offload.       |               |
| <b>Security / header plugin pile-up</b>                                                                                                                                                                              | <b>MEDIUM</b> |
| Wordfence + Limit Login Attempts + WPS Hide Login + Temporary Login Without Password, plus Header Footer Code Manager AND WP Headers And Footers. Overlapping auth gates and duplicate head/footer injection points. |               |
| <b>Dual schema / SEO stacks</b>                                                                                                                                                                                      | <b>MEDIUM</b> |
| Rank Math SEO 1.0.278 plus Schema & Structured Data for WP & AMP 1.66. Competing JSON-LD emitters cause invalid markup and extra frontend work.                                                                      |               |
| <b>Site Kit not connected; environment constants soft</b>                                                                                                                                                            | <b>LOW</b>    |
| Google Site Kit scopes unauthenticated despite a G- measurement ID present. WP_HOME / WP_SITEURL / WP_ENVIRONMENT_TYPE undefined — fragile for CDN URL rewriting and environment parity.                             |               |

## 4. Infrastructure & environment

Allocations that look generous (1G PHP memory, 300s execution) do not prevent Cloudflare 522s when workers are blocked on compile, database, or NitroPack round-trips.

| PARAMETER           | OBSERVED VALUE                  | AUDIT NOTE                                             |
|---------------------|---------------------------------|--------------------------------------------------------|
| Web server          | LiteSpeed                       | Confirmed via Site Health httpd_software               |
| PHP runtime         | 8.2.33 (litespeed SAPI)         | EOL since November 2025                                |
| PHP memory_limit    | 1G                              | Adequate if OPcache healthy                            |
| WP_MEMORY_LIMIT     | 512M                            | Admin may hit ceiling under Elementor                  |
| max_execution_time  | 300s                            | Masks slow jobs; Cloudflare still returns 522          |
| max_input_time      | 60s                             | Tight versus heavy admin POSTs                         |
| upload_max_filesize | 20M                             | Low for furniture CAD/PDF workflows                    |
| Database            | MariaDB 10.11.19                | Supported; database size 518.11 MB                     |
| max_allowed_packet  | 256 MB                          | Adequate                                               |
| max_connections     | 151                             | Watch under BLC + NitroPack pressure                   |
| OPcache             | FULL · 56.6% hit · strings 100% | Immediate resize required                              |
| Disk footprint      | 47.42 GB total                  | Uploads 43.69 GB; plugins 593 MB; themes 44 MB         |
| WordPress           | 7.1.1                           | Theme Astra 4.13.11 (+ Pro 4.13.9); WooCommerce 11.1.0 |

### EOL & 522 linkage

PHP 8.2 is unsupported. Combined with a full OPcache and LiteSpeed LSAPI, cold or thrashing workers stop answering Cloudflare's origin probe → 522 Connection Timed Out. Raising Cloudflare timeouts alone will not remediate saturated OPcache or plugin boot cost.

## 5. Caching & network ingress conflicts

### Cloudflare edge

Proxies [www.ccpatio.com](https://www.ccpatio.com) as WAF + optional HTML cache. On miss, waits for origin; prolonged PHP/DB stall yields HTTP 522. Site Kit reports reference URL <https://www.ccpatio.com> with Search Console property <https://ccpatio.com/> (apex vs www — confirm canonical consistency).

### NitroPack origin layer

advanced-cache.php drop-in + `WP_CACHE=true`. Optimization may trigger origin self-requests (loopbacks) and aggressive purge fan-out when WooCommerce / Elementor content changes. Under plugin churn, purge storms force simultaneous cold PHP boots — worst case for a full OPcache.

| CONFLICT MODE                | SYMPTOM                                        | MITIGATION                                                    |
|------------------------------|------------------------------------------------|---------------------------------------------------------------|
| Double HTML cache            | Stale or thrashing pages; purge races          | One owner: Cloudflare APO/Cache Rules or NitroPack — not both |
| Optimization loopback        | Origin CPU spikes; Cloudflare sees slow origin | Disable NitroPack remote optimize; warm via Cloudflare        |
| Purge on every SKU edit      | Catalog updates → mass cold starts             | Scoped purges; queue; off-peak cron                           |
| Cloudflare ~100s origin wait | Intermittent 522 under load                    | Fix OPcache + plugin boot; do not only raise timeouts         |

## 6. Plugin architecture & bloat analysis

Thirty-eight active plugins categorized by functional domain. The commerce core is justified; dual builders, dual SEO/schema, and always-on operations tools are not.

### 6.1 Domain categorization

| DOMAIN                   | COUNT | PLUGINS                                                                                                                                                                                                      | RISK                                           |
|--------------------------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|
| Caching / CDN            | 1     | NitroPack (+ advanced-cache.php drop-in)                                                                                                                                                                     | Conflicts with Cloudflare; purge/loopback risk |
| Page builders / theme    | 4     | Elementor, Elementor Pro, Spectra Legacy, Astra Pro                                                                                                                                                          | Dual builder bootstrap cost                    |
| Commerce                 | 8     | WooCommerce, Variation Swatches, Premmerce Permalinks, YITH Catalog Mode, Filter Everything, Favorites, CC Patio Rug Catalog, WebToffee Feeds                                                                | Core stack — keep; audit Rug Catalog           |
| Security / access        | 4     | Wordfence, Limit Login Attempts, WPS Hide Login, Temporary Login Without Password                                                                                                                            | Overlap; Temporary Login elevated risk         |
| SEO / schema / analytics | 4     | Rank Math, Schema & Structured Data, Site Kit, accessiBe                                                                                                                                                     | Dual schema; Site Kit disconnected             |
| Forms / CRM / chat       | 3     | Gravity Forms, GF Zapier, Podium                                                                                                                                                                             | Acceptable; watch Zapier webhooks under load   |
| Utilities / ops          | 14    | ACF, Code Snippets (7), Broken Link Checker, Better Search Replace, Redirection, HFCM, WP Headers And Footers, Dynamic QR, PDF Embedder, Importer, Duplicate Post, WP Activity Log, WP Mail SMTP, EMCP Tools | Highest bloat; deactivate non-runtime tools    |

## 6.2 Architectural overlaps

| CONFLICT                                  | RECOMMENDATION                                                                                                                                    |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Elementor Pro ↔ Spectra Legacy            | Pick one builder. Prefer Elementor (already Pro-licensed); deactivate Spectra Legacy and audit Spectra blocks before removal.                     |
| NitroPack ↔ Cloudflare proxy cache        | Single optimization owner. Prefer Cloudflare APO/Cache Rules <i>or</i> NitroPack. Disable NitroPack origin optimization if Cloudflare remains on. |
| Rank Math ↔ Schema & Structured Data      | Disable Schema plugin; consolidate JSON-LD in Rank Math. Validate with Google Rich Results test.                                                  |
| HFCM ↔ WP Headers And Footers             | Consolidate all head/footer injections into one plugin; remove the other.                                                                         |
| Wordfence ↔ Limit Login ↔ WPS Hide Login  | Keep Wordfence as primary. Disable Limit Login if Wordfence lockout covers it; keep Hide Login only if WAF rules are updated.                     |
| Astra Pro hooks ↔ Elementor Theme Builder | Document which templates are Astra vs Elementor; avoid dual header/footer builders.                                                               |

## 6.3 Immediate decommission candidates

| PLUGIN                             | RATIONALE                                                 | URGENCY  |
|------------------------------------|-----------------------------------------------------------|----------|
| Broken Link Checker                | Continuous crawl → MySQL/CPU contention on large catalogs | CRITICAL |
| NitroPack (if Cloudflare retained) | Double-cache architecture explaining intermittent 522s    | CRITICAL |
| Spectra Legacy                     | Redundant with Elementor Pro; legacy maintenance path     | HIGH     |
| Schema & Structured Data           | Duplicates Rank Math schema output                        | HIGH     |
| Temporary Login Without Password   | Standing privilege-escalation vector if unused            | HIGH     |
| WordPress Importer                 | Admin-only tool; must not stay active in production       | HIGH     |
| Better Search Replace              | Destructive DB tool; activate only for migrations         | HIGH     |
| WP Headers And Footers or HFCM     | Duplicate injection layers                                | MEDIUM   |
| EMCP Tools (Premium)               | Unclear runtime need; third-party surface area            | MEDIUM   |
| Dynamic QR Code                    | Likely page-scoped; load only where needed                | LOW      |

#### Code Snippets — retain, but govern

Seven global snippets (Related Products, Add-ons, Breadcrumbs, Finishes Options, Disable Dropdown, Variation with Price, Main Category Link) implement storefront behavior. Do not delete blindly — export to version control and consider promoting to a must-use plugin owned by PrimeView under change control.

## 7. System communication flow

Request path from client through Cloudflare to origin, PHP, plugins, MariaDB, and outbound SaaS. Cloudflare 522 responses occur when the edge (hop 2) waits on hops 3–6.

|                             |                                                                                                                                               |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1. Browser</b>           | HTTPS request to www.ccpatio.com (WooCommerce PDP / archive / Elementor page).                                                                |
| <b>2. Cloudflare Edge</b>   | Proxy + WAF. If HTML is not cached at edge → origin fetch. Miss/purge → full PHP path. Timeout waiting on origin → <b>HTTP 522</b> .          |
| <b>3. Origin LiteSpeed</b>  | TLS terminate; static vs dynamic routing. Hits advanced-cache.php (NitroPack drop-in) before WordPress bootstrap.                             |
| <b>4. PHP (LSAPI)</b>       | PHP 8.2.33 under LiteSpeed. OPcache FULL → compile thrash. Loads WP core + 38 plugins + Astra + 7 Code Snippets.                              |
| <b>5. Application layer</b> | Elementor/Spectra render, WooCommerce queries, Rank Math + Schema JSON-LD, NitroPack optimize/rewrite, Wordfence checks.                      |
| <b>6. MariaDB 10.11</b>     | 518 MB catalog/options/transients. Broken Link Checker + Activity Log + Woo sessions compete for connections (max 151).                       |
| <b>7. Outbound APIs</b>     | NitroPack SaaS, Gravity Forms Zapier, Podium, Site Kit/GA4, Rank Math, accessiBe, WebToffee feeds — each adds latency on admin or cron paths. |

### 7.1 Sequence diagram (Mermaid)

```
sequenceDiagram
    participant B as Browser
    participant CF as Cloudflare Edge
```

```

participant LS as LiteSpeed Origin
participant PHP as PHP 8.2 LSAPI
participant WP as WP Core + 38 Plugins
participant DB as MariaDB 10.11
participant EXT as NitroPack / Zapier / GA / Podium

```

```

alt Edge HTML HIT
  CF-->>B: Cached response
else Edge MISS / BYPASS
  CF->>LS: Origin fetch (timeout → 522)
  LS->>PHP: LSAPI worker
  Note over PHP: OPcache FULL = compile thrash
  PHP->>WP: Bootstrap Astra/Elementor/Woo/NitroPack
  WP->>DB: Queries / transients / sessions
  WP->>EXT: Optional outbound SaaS
  DB-->>WP: Result sets
  WP-->>PHP: Rendered HTML
  PHP-->>LS: Response
  LS-->>CF: Origin body
  CF-->>B: Proxied response
end

```

## 8. Prioritized remediation punch list

Hand this list to PrimeView and hosting before any further feature development. **P0** items are stability gates.

| PRI       | OWNER             | ACTION                                                                                                                                                                                      | ACCEPTANCE CRITERIA                                                                |
|-----------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| <b>P0</b> | Host / SysAdmin   | Resize OPcache: raise memory ( $\geq 256\text{--}512$ MB), interned_strings_buffer ( $\geq 16\text{--}32$ MB), tune revalidate_freq; confirm opcode_cache_full=false and hit rate $>90\%$ . | Site Health shows OPcache not full; measurable p95 TTFB drop on origin.            |
| <b>P0</b> | PrimeView + Host  | Resolve CF 522s: raise LiteSpeed workers / PHP LSAPI children; disable NitroPack <i>or</i> Cloudflare HTML cache — pick one; purge both after change.                                       | Zero 522s for 72 hours in Cloudflare Analytics; origin responds $<5\text{s}$ warm. |
| <b>P0</b> | PrimeView         | Deactivate Broken Link Checker immediately; remove from autoload; clear BLC cron hooks.                                                                                                     | No BLC cron in wp-cron / Action Scheduler; DB write rate drops.                    |
| <b>P1</b> | PrimeView         | Deactivate Spectra Legacy, Schema plugin, Importer, Better Search Replace, Temporary Login (if unused); consolidate header plugins.                                                         | Active plugin count $\leq 28$ ; no dual schema in view-source.                     |
| <b>P1</b> | Host              | Plan PHP 8.3 (or 8.4) upgrade on a staging clone first; run WooCommerce / Elementor / cache-plugin compatibility matrix.                                                                    | Staging on supported PHP with green smoke tests.                                   |
| <b>P1</b> | PrimeView         | Set WP_DEBUG=false in production; retain rotated DEBUG_LOG only under incident flag; define WP_ENVIRONMENT_TYPE=production and hardcode WP_HOME / WP_SITEURL.                               | Site Health constants match; log growth rate controlled.                           |
| <b>P2</b> | PrimeView + Media | Media lifecycle: offload/archive cold uploads, regenerate WebP/AVIF, raise upload limits only after CDN offload.                                                                            | Uploads directory trend flat or declining month-over-month.                        |
| <b>P2</b> | PrimeView         | Freeze net-new plugin installs until stability gate passes; document Code Snippets 8–14 as version-controlled mu-plugin candidates.                                                         | Change-control checklist signed; snippets in repository.                           |
| <b>P2</b> | Ops               | Reconnect or remove Google Site Kit; verify Rank Math Search Console ownership; enable consent mode if accessiBe/CMP required.                                                              | Analytics auth green or plugin removed.                                            |
| <b>P3</b> | Agency            | Staging parity: clone production with same LiteSpeed / PHP / OPcache; load-test product archive + variation PDP before further feature work.                                                | Staging survives 50 concurrent PDP loads without 5xx.                              |

## 9. Stability gate (stop-ship criteria)

No net-new feature development (Elementor templates, Spectra work, VividWorks embeds, large catalog imports, or production PHP major upgrades without staging proof) until the following are true:

### Must be true

- OPcache not full; hit rate  $\geq 90\%$
- Active plugins  $\leq 28$  after decommissions
- Single cache owner (Cloudflare *xor* NitroPack)
- Broken Link Checker deactivated; no crawl crons
- WP\_DEBUG false in production
- 72 hours with zero Cloudflare 522s

### Explicitly deferred until gate

- New Elementor templates / Spectra work
- VividWorks configurator embeds
- Large catalog imports / feed regenerations
- Production PHP major upgrade without staging proof

## 10. Appendix — evidence snapshot

| ITEM              | VALUE FROM SITE HEALTH DUMP                       |
|-------------------|---------------------------------------------------|
| Site              | https://www.ccpatio.com (production)              |
| WordPress         | 7.1.1 · en_US · permalink /%category%/%postname%/ |
| Theme             | Astra 4.13.11 (latest 4.13.12) + Astra Pro 4.13.9 |
| Active plugins    | 38                                                |
| Code Snippets     | 7 global snippets (IDs 8–14)                      |
| Drop-in           | advanced-cache.php = true                         |
| WP_CACHE          | true                                              |
| WP_DEBUG          | true (display false; log enabled)                 |
| Uploads size      | 43.69 GB                                          |
| Database size     | 518.11 MB                                         |
